

Lessons Learned from Verifying Actual C Code with Frama-C

PRiML Workshop

Virgile Prevosto
virgile.prevosto@cea.fr

Université Paris-Saclay, CEA, List

2021-07-12

```
if (long n)
  for (i = 0; i < n; i++)
    C[i] = 0;
  tmp2 = 0;
  // ... of the
```

```
tmp2[i] = 0; // ... (n-1) also if (tmp1[i]) >= 0; // ... (n-1) - 1; else tmp2[i] = -tmp1[i]; // ... Then the second part takes the first one:
tmp1[i] = 0; k = 5; k--> tmp1[i][k] += mc2[i][k] * tmp2[k]; // The [i][k] coefficient of the matrix product MC2*TMP2, that is: *MC2*(TMP1) = MC2*(MC1*M1) = MC2*M1*MC1
i = 1; tmp1[0][i] >= 1; // Final rounding: tmp2[0][i] is now represented on 9 bits: *if (tmp1[0][i] < -256) m2[0][i] = -256; else if (tmp1[0][i] > 255) m2[0][i] = 255; else m2[0][i] = tmp1[0][i];
```

The Frama-C Platform

Verifying C Programs in the Wild

Some Challenges in C Code Analysis

Benefits of Addressing a Mainstream Language

Perspectives and Conclusion

- ▶ <https://frama-c.com/>
- ▶ A Framework for modular analysis of C code.
- ▶ Initially developed at CEA List and Inria
- ▶ Kernel based on CIL (Necula et al. – Berkeley).
- ▶ Released under LGPL license (v23.0 Vanadium in June 2021)
- ▶ ACSL annotation language.
- ▶ Extensible platform
 - ▶ Collaboration of analyses over same code
 - ▶ Inter plug-in communication through ACSL formulas.
 - ▶ Adding specialized plug-ins is easy

Main Frama-C plugins

Presentation

- ▶ Based on the notion of contract, like in Eiffel
- ▶ Allows users to specify functional properties of their code
- ▶ Allows communication between various plugins
- ▶ Independent from a particular analysis
- ▶ ACSL reference manual at
<https://github.com/acsl-language/acsl>

Example of ACSL Specification

```
/*@  
requires ptr_val: \valid(a) && \valid(b);  
requires ptr_sep: \separated(a,b);  
ensures a_val: \at(*a,Pre) == *b;  
ensures b_val: \at(*b,Pre) == *a;  
*/  
void swap(int* a, int* b);
```

Absence of Runtime Errors

- ▶ Long-term partnership with EdF and Areva/Framatome
- ▶ Fuelled many developments in the **Eva** plug-in
- ▶ [Nucl. Eng. Tech., 2015]

Image ©Daniel Jolivet CC-BY-2.0

- ▶ Journey to a RTE-free X.509 parser
- ▶ [\[SSTIC'19\]](#)
- ▶ Analysis conducted by ANSSI
- ▶ Mixing Eva and WP plug-ins
- ▶ More complex structures than embedded code

Verification of Functional Properties

- ▶ Long-term partnership with Airbus
- ▶ Fuelled many developments in the WP plug-in
- ▶ Fully integrated in the software toolchain
- ▶ Including some internally-developed plug-ins
- ▶ [ERTS'20]

Verification of Functional Properties (2)

- ▶ Experiments on the Contiki OS
- ▶ Part of the H2020 project Vessedia
- ▶ Uses WP to prove correctness of the List module
- ▶ **Ghost code** as intermediate between code and spec
- ▶ [\[SAC'19\]](#)

- ▶ Experiments on the WooKey bootloader
- ▶ Part of Virgile Robles' PhD (MetAcsl plug-in)
- ▶ **Integrity**: bootloader does not write on data banks
- ▶ **Confidentiality**: bootloader only reads what's needed to compute checksums
- ▶ [Formalise'21]

Have a Complete, Parseable Code Base

```
#include "somelib/hdr.h"  
...  
#if SOMECOND==42  
extern  
    void builtin_f(  
        int x, int y);  
#endif  
...
```

- ▶ How to determine complete list of dependencies?
- ▶ Which configuration to use for pre-processing?
- ▶ Will there be some vendor-dependent functions?

```
#pragma pack(push, 4)
struct S_aligned_4 {
    ...
}
#pragma pack(pop)

...
```

- ▶ Many extensions exist beyond ISO C
- ▶ Frama-C support added on a case-by-case basis

Intricacies of ISO C Standard

```
unsigned char x[1];  
x[0] = x[0];  
x[0] += 0;  
x[0] *= 0;  
if (x[0] != x[0]) {  
    /* might not  
       be dead  
       according to  
       standard  
       */  
}
```

- ▶ Standard is sometimes extremely arcane
- ▶ With unintended interactions between various sections
- ▶ Example: a non-volatile location whose value is allowed to vary
- ▶ Spoiler alert: Frama-C is a bit conservative and will warn on line 2 about access to uninitialized value

```

struct S {
short x;
int y;
} s[2];
    
```

- ▶ Each memory block can be used as **unsigned char** []
- ▶ Padding bytes have a peculiar status
- ▶ Potential aliases can be very complex
- ▶ Eva allows for very low-level memory operations
- ▶ WP relies on a more abstract model

No Tough Design Choices

- ▶ The C standard is always right
 - ▶ Just need to understand what it means
- ▶ Always possible to restrict a plug-in to a subset of C
 - ▶ Unsupported cases are more explicit
 - ▶ Facilitates writing examples for adding new feature

- ▶ Just go to Github!
- ▶ Or to specific C code repositories (e.g. [Juliet test suite](#))
- ▶ [Open-source Case Studies](#)
- ▶ Very useful also for finding new exercises when teaching
- ▶ Pretty much the only way to have examples of meaningful size

- ▶ language-lawyer tag on StackOverflow
- ▶ Plenty of tooling
 - ▶ CIL
 - ▶ Clang
 - ▶ JCDB
 - ▶ LSP
 - ▶ ...

- ▶ Common ground with anyone who knows C
- ▶ Applied research at the heart of CEA List's mission
- ▶ Ensure focus is on concrete problems faced by our partners
- ▶ Does not preclude looking at more fundamental work

From Documentation to Formal Specification

- ▶ [Decoder H2020 project](#)
- ▶ Provide a unified platform for storing all relevant documents for a given software project
- ▶ Use AI models to extract information from informal documents and/or code
- ▶ Help user write formal specifications

Frama-C and Continuous Integration

- ▶ LEIA project
- ▶ Newly funded as part of French [Grand Défi Cyber](#)
- ▶ Work on scalability and reuse of analysis results over small code changes

- ▶ A mature framework for specifying and verifying properties of C code
- ▶ Address both safety and security analysis
- ▶ Many areas for enhancements: new abstract domains, modular Eva, new WP region-based memory models, C++ (or other) front-end, higher-level properties, ...
- ▶ Integration in the whole software development cycle
- ▶ Importance of concrete use-cases to steer development in interesting directions
- ▶ Collaborations welcome!
